Nov 12, 2021 (Revised Feb 15, 2022)

1 Project Description

I will be working with Professor Wenting Zheng and her PhD student Edward Chen to develop a fully homomorphic encryption (FHE) back-end to CirC, "an infrastructure for building compilers to" existentially quantified circuits, an abstraction suitable for implementing cryptographic primitives [8].

Homomorphic encryption is a special type of encryption that supports computation on encrypted data without the need to decrypt it first. FHE is the a specific type homomorphic encryption that supports multiple operations to an unlimited depth.

Practical FHE can open doors to new applications that operate on sensitive data. Concerns over privacy violations make sensitive user data, such as geographic data, medical records, and video footage, hard to use in untrusted environments, such as the cloud [5]. However, FHE can lift these restrictions by allowing computations to be performed on encrypted data. Therefore, malicious adversaries in the untrusted environment cannot gain access to any of the underlying plaintext data.

Unfortunately, modern day FHE has some glaring weaknesses. First, running FHE computations is extremely slow. Running computations on homomorphically encrypted data is orders of magnitude slower than running computations on unencrypted data. Second, developing FHE programs is unfriendly and requires a strong cryptographic background. "Even for experts, this process is laborious", as it entails the careful use of "addition, multiply, and rotation instructions while minimizing noise accumulation" [2].

Our goal with this project is to overcome the weaknesses of FHE by implementing an FHE back-end into CirC, a shared compiler infrastructure extensible to a variety of cryptographic back-ends. The key abstraction of CirC is the CirC Intermediate Representation (CirC-IR). Designers can implement front-ends (i.e. C, Zokrates) that compile to the CirC-IR and add cryptographic back-ends (i.e. SMT Solver, Proof Systems) that compile from the CirC-IR. Additionally, optimization passes applied to CirC-IR, such as determining optimal relinearization placement, can greatly improve the performance of FHE programs [8].

Implementing an FHE back-end will allow developers to write FHE programs using front-end languages such as C without the requirement of having a strong cryptographic background. The extensible front-end of CirC will allow developers to easily integrate CirC into their system. Also, it will remove the necessity of having to worry about minimizing noise, as this will be done automatically by the compiler. Additionally, IR-based optimization passes can improve the speed of FHE programs compiled using CirC. Finally, integrating a FHE back-end into CirC will enable new opportunities to explore applications that require primitive mixing, using two or more cryptographic primitives to improve the performance of secure computations.

2 Project Goals

75% Project Goal	- Develop a working FHE back-end for CirC
100% Project Goal	- Incorporate EVA optimizations [3] into CirC
	- Pass the benchmark tests
125% Project Goal	- All of the above
	- Implement IR optimizations
	- Apply CirC in FHE + MPC program (i.e. Gazelle) [6]

3 Project Milestones

• Yellow: Goals for before the spring semester

Green: 75% Goals Blue: 100% Goals Red: 125% Goals

Prerequisites - Learn Rust and Git - Familiarize myself with the CirC code base - Familiarize myself with the backend compiler passes - Complete starter compiler tasks - Incorporate Microsoft SEAL into the CirC repository Refer to EVA compiler [3] / ABY back-end [4] - Identify which benchmarks we want to run - Begin incorporating binary operations - Write corresponding test cases - Begin implementing Map in CirC IR - Make PR for IR Map and pass the tests - Begin implementing VM Bytecode for SEAL compilation - Finalize and merge the IR Map capabilities - Implement input parsing for SEAL interpreter - Incorporate Boolean operations for SEAL interpreter - Incorporate Boolean operations for SEAL interpreter - Update FHE backend to support SEAL interpreter - Implement and test additional operations i.e. add, negate, subtract, multiply, rotate - Incorporate an optimization pass - Add graph based optimizations that determine the best locations to add mod switches/relinearization/bootstrapping May 4th - Run benchmarks on FHE compiler backend - Prepare for presentation - Add further optimizations - Integrate an FHE + MPC program		
Familiarize myself with the backend compiler passes Complete starter compiler tasks Incorporate Microsoft SEAL into the CirC repository Refer to EVA compiler [3] / ABY back-end [4] Identify which benchmarks we want to run Begin incorporating binary operations Write corresponding test cases Begin implementing Map in CirC IR March 1st March 1st Begin implementing VM Bytecode for SEAL compilation Finalize and merge the IR Map capabilities Implement input parsing for SEAL interpreter Incorporate Boolean operations for SEAL interpreter Implement and test additional operations i.e. add, negate, subtract, multiply, rotate Incorporate an optimization pass Add graph based optimizations that determine the best locations to add mod switches/relinearization/bootstrapping May 4th Prepare for presentation Add further optimizations	Prerequisites	- Learn Rust and Git
- Familiarize myself with the backend compiler passes - Complete starter compiler tasks - Incorporate Microsoft SEAL into the CirC repository Refer to EVA compiler [3] / ABY back-end [4] - Identify which benchmarks we want to run - Begin incorporating binary operations - Write corresponding test cases - Begin implementing Map in CirC IR March 1st - Make PR for IR Map and pass the tests - Begin implementing VM Bytecode for SEAL compilation - Finalize and merge the IR Map capabilities - Implement input parsing for SEAL interpreter - Incorporate Boolean operations for SEAL interpreter - Update FHE backend to support SEAL interpreter - Update FHE backend to support SEAL interpreter - Implement and test additional operations i.e. add, negate, subtract, multiply, rotate - Incorporate an optimization pass - Add graph based optimizations that determine the best locations to add mod switches/relinearization/bootstrapping May 4th - Prepare for presentation - Add further optimizations		- Familiarize myself with the CirC code base
February 1st - Incorporate Microsoft SEAL into the CirC repository Refer to EVA compiler [3] / ABY back-end [4] - Identify which benchmarks we want to run - Begin incorporating binary operations - Write corresponding test cases - Begin implementing Map in CirC IR - Make PR for IR Map and pass the tests - Begin implementing VM Bytecode for SEAL compilation - Finalize and merge the IR Map capabilities - Implement input parsing for SEAL interpreter - Incorporate Boolean operations for SEAL interpreter - Update FHE backend to support SEAL interpreter - Implement and test additional operations i.e. add, negate, subtract, multiply, rotate - Incorporate an optimization pass - Add graph based optimizations that determine the best locations to add mod switches/relinearization/bootstrapping May 4th - Prepare for presentation - Add further optimizations		- Familiarize myself with the backend compiler passes
Refer to EVA compiler [3] / ABY back-end [4] - Identify which benchmarks we want to run - Begin incorporating binary operations - Write corresponding test cases - Begin implementing Map in CirC IR - Make PR for IR Map and pass the tests - Begin implementing VM Bytecode for SEAL compilation - Finalize and merge the IR Map capabilities - Implement input parsing for SEAL interpreter - Incorporate Boolean operations for SEAL interpreter - Update FHE backend to support SEAL interpreter - Implement and test additional operations i.e. add, negate, subtract, multiply, rotate - Incorporate an optimization pass - Add graph based optimizations that determine the best locations to add mod switches/relinearization/bootstrapping May 4th - Run benchmarks on FHE compiler backend - Prepare for presentation - Add further optimizations		- Complete starter compiler tasks
- Identify which benchmarks we want to run - Begin incorporating binary operations - Write corresponding test cases - Begin implementing Map in CirC IR - Make PR for IR Map and pass the tests - Begin implementing VM Bytecode for SEAL compilation - Finalize and merge the IR Map capabilities - Implement input parsing for SEAL interpreter - Incorporate Boolean operations for SEAL interpreter - Incorporate Boolean operations for SEAL interpreter - Update FHE backend to support SEAL interpreter - Implement and test additional operations i.e. add, negate, subtract, multiply, rotate - Incorporate an optimization pass - Add graph based optimizations that determine the best locations to add mod switches/relinearization/bootstrapping May 4th - Run benchmarks on FHE compiler backend - Prepare for presentation Stretch - Add further optimizations	February 1st	- Incorporate Microsoft SEAL into the CirC repository
- Begin incorporating binary operations - Write corresponding test cases - Begin implementing Map in CirC IR March 1st - Make PR for IR Map and pass the tests - Begin implementing VM Bytecode for SEAL compilation - Finalize and merge the IR Map capabilities - Implement input parsing for SEAL interpreter - Incorporate Boolean operations for SEAL interpreter - Update FHE backend to support SEAL interpreter - Implement and test additional operations i.e. add, negate, subtract, multiply, rotate - Incorporate an optimization pass - Add graph based optimizations that determine the best locations to add mod switches/relinearization/bootstrapping May 4th - Prepare for presentation - Add further optimizations		Refer to EVA compiler [3] / ABY back-end [4]
February 15th - Write corresponding test cases - Begin implementing Map in CirC IR March 1st - Make PR for IR Map and pass the tests - Begin implementing VM Bytecode for SEAL compilation - Finalize and merge the IR Map capabilities - Implement input parsing for SEAL interpreter - Incorporate Boolean operations for SEAL interpreter - Update FHE backend to support SEAL interpreter - Implement and test additional operations i.e. add, negate, subtract, multiply, rotate - Incorporate an optimization pass - Add graph based optimizations that determine the best locations to add mod switches/relinearization/bootstrapping May 4th - Run benchmarks on FHE compiler backend - Prepare for presentation - Add further optimizations		- Identify which benchmarks we want to run
- Begin implementing Map in CirC IR - Make PR for IR Map and pass the tests - Begin implementing VM Bytecode for SEAL compilation - Finalize and merge the IR Map capabilities - Implement input parsing for SEAL interpreter - Incorporate Boolean operations for SEAL interpreter - Update FHE backend to support SEAL interpreter - Implement and test additional operations i.e. add, negate, subtract, multiply, rotate - Incorporate an optimization pass - Add graph based optimizations that determine the best locations to add mod switches/relinearization/bootstrapping May 4th - Prepare for presentation Stretch - Add further optimizations	February 15th	- Begin incorporating binary operations
March 1st - Make PR for IR Map and pass the tests - Begin implementing VM Bytecode for SEAL compilation - Finalize and merge the IR Map capabilities - Implement input parsing for SEAL interpreter - Incorporate Boolean operations for SEAL interpreter - Update FHE backend to support SEAL interpreter - Implement and test additional operations i.e. add, negate, subtract, multiply, rotate - Incorporate an optimization pass - Add graph based optimizations that determine the best locations to add mod switches/relinearization/bootstrapping May 4th - Run benchmarks on FHE compiler backend - Prepare for presentation - Add further optimizations		- Write corresponding test cases
- Begin implementing VM Bytecode for SEAL compilation - Finalize and merge the IR Map capabilities - Implement input parsing for SEAL interpreter - Incorporate Boolean operations for SEAL interpreter - Update FHE backend to support SEAL interpreter - Implement and test additional operations i.e. add, negate, subtract, multiply, rotate - Incorporate an optimization pass - Add graph based optimizations that determine the best locations to add mod switches/relinearization/bootstrapping May 4th - Prepare for presentation - Add further optimizations		- Begin implementing Map in CirC IR
- Begin implementing VM Bytecode for SEAL compilation - Finalize and merge the IR Map capabilities - Implement input parsing for SEAL interpreter - Incorporate Boolean operations for SEAL interpreter - Update FHE backend to support SEAL interpreter - Implement and test additional operations i.e. add, negate, subtract, multiply, rotate - Incorporate an optimization pass - Add graph based optimizations that determine the best locations to add mod switches/relinearization/bootstrapping May 4th - Run benchmarks on FHE compiler backend - Prepare for presentation Stretch - Add further optimizations	March 1st	- Make PR for IR Map and pass the tests
- Implement input parsing for SEAL interpreter - Incorporate Boolean operations for SEAL interpreter - Update FHE backend to support SEAL interpreter - Implement and test additional operations i.e. add, negate, subtract, multiply, rotate - Incorporate an optimization pass - Add graph based optimizations that determine the best locations to add mod switches/relinearization/bootstrapping May 4th - Run benchmarks on FHE compiler backend - Prepare for presentation - Add further optimizations		- Begin implementing VM Bytecode for SEAL compilation
- Incorporate Boolean operations for SEAL interpreter - Update FHE backend to support SEAL interpreter - Implement and test additional operations	March 23th	- Finalize and merge the IR Map capabilities
- Update FHE backend to support SEAL interpreter - Implement and test additional operations i.e. add, negate, subtract, multiply, rotate - Incorporate an optimization pass - Add graph based optimizations that determine the best locations to add mod switches/relinearization/bootstrapping May 4th - Run benchmarks on FHE compiler backend - Prepare for presentation - Add further optimizations		- Implement input parsing for SEAL interpreter
April 4th - Implement and test additional operations i.e. add, negate, subtract, multiply, rotate - Incorporate an optimization pass - Add graph based optimizations that determine the best locations to add mod switches/relinearization/bootstrapping - Run benchmarks on FHE compiler backend - Prepare for presentation - Add further optimizations		- Incorporate Boolean operations for SEAL interpreter
i.e. add, negate, subtract, multiply, rotate - Incorporate an optimization pass - Add graph based optimizations that determine the best locations to add mod switches/relinearization/bootstrapping May 4th - Run benchmarks on FHE compiler backend - Prepare for presentation - Add further optimizations	April 4th	- Update FHE backend to support SEAL interpreter
- Incorporate an optimization pass - Add graph based optimizations that determine the best locations to add mod switches/relinearization/bootstrapping May 4th - Run benchmarks on FHE compiler backend - Prepare for presentation - Add further optimizations		- Implement and test additional operations
April 18th - Add graph based optimizations that determine the best locations to add mod switches/relinearization/bootstrapping - Run benchmarks on FHE compiler backend - Prepare for presentation - Add further optimizations		i.e. add, negate, subtract, multiply, rotate
Cations to add mod switches/relinearization/bootstrapping - Run benchmarks on FHE compiler backend - Prepare for presentation - Add further optimizations	April 18th	- Incorporate an optimization pass
- Run benchmarks on FHE compiler backend - Prepare for presentation - Add further optimizations		- Add graph based optimizations that determine the best lo-
- Prepare for presentation - Add further optimizations		cations to add mod switches/relinearization/bootstrapping
Stretch - Prepare for presentation - Add further optimizations	May 4th	- Run benchmarks on FHE compiler backend
Stretch		- Prepare for presentation
- Integrate an FHE + MPC program	Stretch	- Add further optimizations
		- Integrate an FHE + MPC program

4 Literature Search

To understand the CirC infrastructure, I will need to read "Unifying Compilers for SNARKs, SMT, and More" [8], which is a paper that describes the CirC infrastructure. "Porcupine: A Synthesizing Compiler for Vectorized Homomorphic Encryption" [2], "An Encrypted Vector Arithmetic Language and Compiler for Efficient Homomorphic Computation" [3], and "SoK: Fully Homomorphic Encryption Compilers" [9] will be good references to how to implement a compiler for FHE and how to add optimizations. As the back-end will be written in Rust, the Rust Handbook [7] will be essential. Finally, the Dragon Book [1] will be helpful in learning about the workings of compilers.

5 Resources Needed

For my code editor, I will use Visual Studio Code. I will also need a server to test the benchmarks. For this, the CMU SNAP group has a cluster of servers that I will use to perform the benchmarks.
